技术规格

| Background: | This gene belongs to the protein arginine methyltransf erase (PRMT) family. The encoded enzyme catalyzes the methylation of guanidino nitrogens of arginyl residuces of proteins. The enzyme acts specifically on histones and other chromatin-associated proteins and is involved in regulation of gene expression. The enzyme may act in association with other proteins or within multiparotein complexes and may play a role in cell type-specific functions and cell lineage specification. A related pseudogene is located on chromosome 9. |
