技术规格

Background:	This gene encodes a protein that is a member of th e dickkopf family. The secreted protein contains two cysteine rich regions and is involved in embryonic d evelopment through its interactions with the Wnt si gnaling pathway. It can act as either an agonist or a ntagonist of Wnt/beta-catenin signaling, depending on the cellular context and the presence of the co-f actor kremen 2. Activity of this protein is also modu lated by binding to the Wnt co-receptor LDL-recept or related protein 6 (LRP6).
Applications:	ELISA, IHC
