## 技术规格

**Background:** 

The protein encoded by this gene is a member of the d ual specificity protein phosphatase subfamily. These pho sphatases inactivate their target kinases by dephosphoryl ating both the phosphoserine/threonine and phosphotyr osine residues. They negatively regulate members of the mitogen-activated protein (MAP) kinase superfamily (MA PK/ERK, SAPK/JNK, p38), which are associated with cellul ar proliferation and differentiation. Different members of the family of dual specificity phosphatases show distinct substrate specificities for various MAP kinases, different t issue distribution and subcellular localization, and differe

	nt modes of inducibility of their expression by extracellu lar stimuli.
