技术规格

Background:	Histones play a critical role in transcriptional regulation, cell cycle progression, and developmental events. Histone acetylation /deacetylation alters chromosome structure and affects transcription factor access to DNA. The protein encoded by this gene belongs to class II of the histone deacetylase/acuc/apha family. It possesses histone deacetylase activity and represses transcription when tethered to a promoter.
Applications:	WB
Name of antibody:	HDAC4(Ab-632)
Immunogen:	Synthesized non-phosphopeptide derived from human HDAC4 around the phosphorylation site of serine 632.

Full name:	histone deacetylase 4
Synonyms :	HD4; AHO3; BDMR; HDACA; HA6116; HDAC-4; HDAC-A
SwissProt:	P56524
WB Predicted band size:	119 kDa
WB Positive control:	Hela cells and Jurkat cells lysates
WB Recommended dilution:	500-3000
