技术规格

Background:	This gene encodes a transcription factor that contains both basic helix-loop-helix and leucine zipper structural features. It regulates the differentiation and development of melanocytes retinal pigment epithelium and is also responsible for pigment cell-specific transcription of the melanogenesis enzyme genes. Heterozygous mutations in the this gene cause auditory-pigmentary syndromes, such as Waardenburg syndrome type 2 and Tietz syndrome.
Applications:	WB
Name of antibody:	MITF(Phospho-Ser180/73)
Immunogen:	Peptide sequence around phosphorylation site of Serine 18

	0(P-N-S(p)-P-M)/Serine 73(Q-E-R(p)-R-E) derived from Human MITF.
Full name:	microphthalmia-associated transcription factor
