技术规格

Background	Immunoglobulin G (IgG),is one of the most abundant proteins in serum wi
	th normal levels between 9.5-12.5 mg/ml in adult blood. IgG is important
	for our defense against microorganisms and the molecules are produced b
	y B lymphocytes as a part of our adaptive immune response. The IgG mol
	ecule has two separate functions; to bind to the pathogen that elicited th
	e response and to recruit other cells and molecules to destroy the antigen
	. The variability of the IgG pool is generated by somatic recombination an
	d the number of specificities in an individual at a given time point is esti
	mated to be 1011 variants.
