技术规格

Background:	This gene encodes a member of the steroid-thyroid hormone-retinoid receptor superfamily. Expression is induced by phytohemagglutinin in human lymphocytes and by serum stimulation of arrested fibroblasts. The encoded protein acts as a nuclear transcription factor. Translocation of the protein from the nucleus to mitochondria induces apoptosis. Multiple transcript variants encoding different isoforms have been found for this gene.
Applications:	IHC
Name of antibody:	NR4A1(Phospho-Ser351)
Immunogen:	Peptide sequence around phosphorylation site of Serine351 (L-P-S(p)-K-P) derived from Human Nuclear Receptor NR4A1.

Full name:	nuclear receptor subfamily 4, group A, member 1
Synonyms :	HMR; N10; TR3; NP10; GFRP1; NAK-1; NGFIB; NUR77
SwissProt:	P22736
IHC positive control:	Human colon carcinoma tissue
IHC Recommend dilution:	50-100
