Background:	This gene encodes a single-pass type I membrane glycoprotein with two Ig-like C2-type domains and an Ig-like V-type domain. This protein is one of the plasma membrane components of adh erens junctions. It also serves as an entry for certain mutant strai ns of herpes simplex virus and pseudorabies virus, and it is invol ved in cell to cell spreading of these viruses. Variations in this g ene have been associated with differences in the severity of mult

iple sclerosis. Alternate transcriptional splice variants, encoding di
fferent isoforms, have been characterized. [provided by RefSeq, J
