UR OC28 is up-regulated in prostate, breast and bladder can cer, and is thereby considered a useful target for diagnos is and treatment of these cancers. UROC28 is encoded by a gene located on human chromosome 6, which contains 170 million base pairs and comprises nearly 6% of the hu man genome. Deletion of a portion of the q arm of chro mosome 6 is associated with early onset intestinal cancer, suggesting the presence of a cancer susceptibility locus. Additionally, Porphyria cutanea tarda, Parkinson's disease, Stickler syndrome and a susceptibility to bipolar disorder are all associated with genes that map to chromosome 6.
