技术规格

Background:	This gene is a member of the cullin family. The encode d protein forms a complex that functions as an E3 ubiq uitin ligase and catalyzes the polyubiquitination of specif ic protein substrates in the cell. The protein interacts wit h a ring finger protein, and is required for the proteolys is of several regulators of DNA replication including chr omatin licensing and DNA replication factor 1 and cyclin E. Multiple transcript variants encoding different isoform s have been found for this gene. [provided by RefSeq, J ul 2008].
