技术规格

Background:	May be involved in dorsoventral axis formation. Seems to antagonize BMP signaling by forming ternary complexes with CHRDL1 and BMPs, thereby preventing BMPs from binding to their receptors. In addition to the anti-BMP function, also has pro-BMP activity, partly mediated by cleavage and degradation of CHRDL1, which releases BMPs from ternary complexes. May be an important modulator of BMP-regulated cartilage development and chondrocyte differentiation. May play a role in thymocyte development (By similarity).
