技术规格

Background:	The protein encoded by this gene is a member of the calcium-binding protein superfamily that includes calmo dulin and troponin C. Originally described as a 27 kDa protein, it is now known to be a 28 kDa protein. It con tains four active calcium-binding domains, and has two modified domains that are thought to have lost their c alcium binding capability. This protein is thought to buf fer entry of calcium upon stimulation of glutamate rece ptors. Depletion of this protein was noted in patients w ith Huntington disease.
